The American Association for Respiratory Care (AARC) opposes the use of e-cigarettes, “vapes,” or any device that is use to aerosolize or vaporize non-therapeutic liquids to deliver intoxicants, stimulants or other chemicals and compounds through inhalation. Even though the concept of using the e-cigarettes for smoking cessation is attractive, it has not been fully studied and further research is needed. As such, the AARC does not recommend the use of e-cigarettes as a cessation method. For those that would like to quit smoking, there are several U. S. Food and Drug Administration (FDA) approved medications that are safe and effective for the purpose of inhalation. A combination of medication and behavioral counseling has been shown to work best. The AARC supports smoking cessation counseling by respiratory therapists who as allied health professionals have expertise in pulmonary medicine. The Surgeon General’s 2020 Report on Smoking Cessation concludes, “Smoking cessation improves health status and enhances quality of life” and is beneficial at any age.’ The AARC strongly supports this position.

The use of e-cigarette products had increased at an alarming rate among young people. The latest generation of e-cigarette devices deliver large amount of nicotine to the brain significantly increasing the risk of nicotine addiction and harm to developing brains of young adults. E-cigarettes also contain chemicals harmful to lung Health. These include heavy metals, carcinogens, vegetable glycerin and propylene glycol all of which increase the risk of irreversible lung damage and lung disease. Additional safety concerns are emerging related to the inhalation of the liquid nicotine solution (LNS) by young children as poison control centers report a continual increase in calls as e-cigarettes become more popular.
